ENVIRONMENT AND EARTH SCIENCES  
DUKE UNIVERSITY

# Afforestation

- Kyoto Protocol:  
Conversion of land  
that has not been  
forested for >50  
years
- Exotic tree spp
  - *Eucalyptus*
  - *Pinus*
  - *Acacia*

# Global Forest Change

**Changes in plantation area, 1990–2005**  
(million ha)

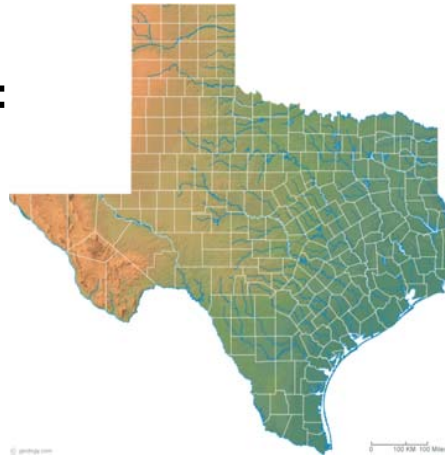

140 million ha  
plantation globally

2.8 million ha  
added each year

140 million hectares  
Afforested total in 2005

=

2.8 million hectares afforested  
Per year in the 2000s

=

# Why Afforest?

CO<sub>2</sub> Sequestration

Salinization Control

Erosion Control

# Why Afforest?

Plantations=3.8% of forest area

However, 35% of Wood products

Source=FAO, 2000

# Costs of Afforestation

- Decreased streamflow
- Lower pH
- Salinized stream and groundwater

## Depletion of soil nutrients

# Project Goals

- Create global database of effects of afforestation on grassland soils
- Evaluate effect of afforestation on:  
Cations, Carbon, Nitrogen, pH
- Long-term sequestration potential
- How to ameliorate effects

# Research Approach

- All available published literature on afforestation and soil
  - 71 papers, 153 sites
- Values of grassland and control for exchangeable cations, carbon, nitrogen, pH for mineral soil
- Converted to stocks ( $\text{g/m}^2$ ) with bulk density

$$BD = \frac{100}{\frac{OM\%}{0.244} + \frac{100 - OM\%}{1.64}}$$

# The Dataset: 71 studies, 153 independent sites

*Eucalyptus spp*

*Pinus spp*

Other  
Angiosperms

Other  
Conifers

*Mixed Other*

## Countries:

New Zealand,  
Sweden, United  
Kingdom, United  
States (including  
Hawaii and Puerto  
Rico), India,  
Ecuador, Argentina,  
Germany, Brazil,  
China, Russia,  
Costa Rica, South  
Africa, Belgium,  
Denmark, Australia,  
Philippines, Chile,  
Italy, Spain

# Research Approach, Continued

- Effect calculated as response ratio

$$lr = \ln\left(\frac{X_T}{X_C}\right)$$

- Where  $X_T$  = value for plantation and  $X_C$  = value for control
- Standardizes for differences in control (grassland) values
- Values centered at 0; increase in afforestation value=positive lr; decrease=negative lr

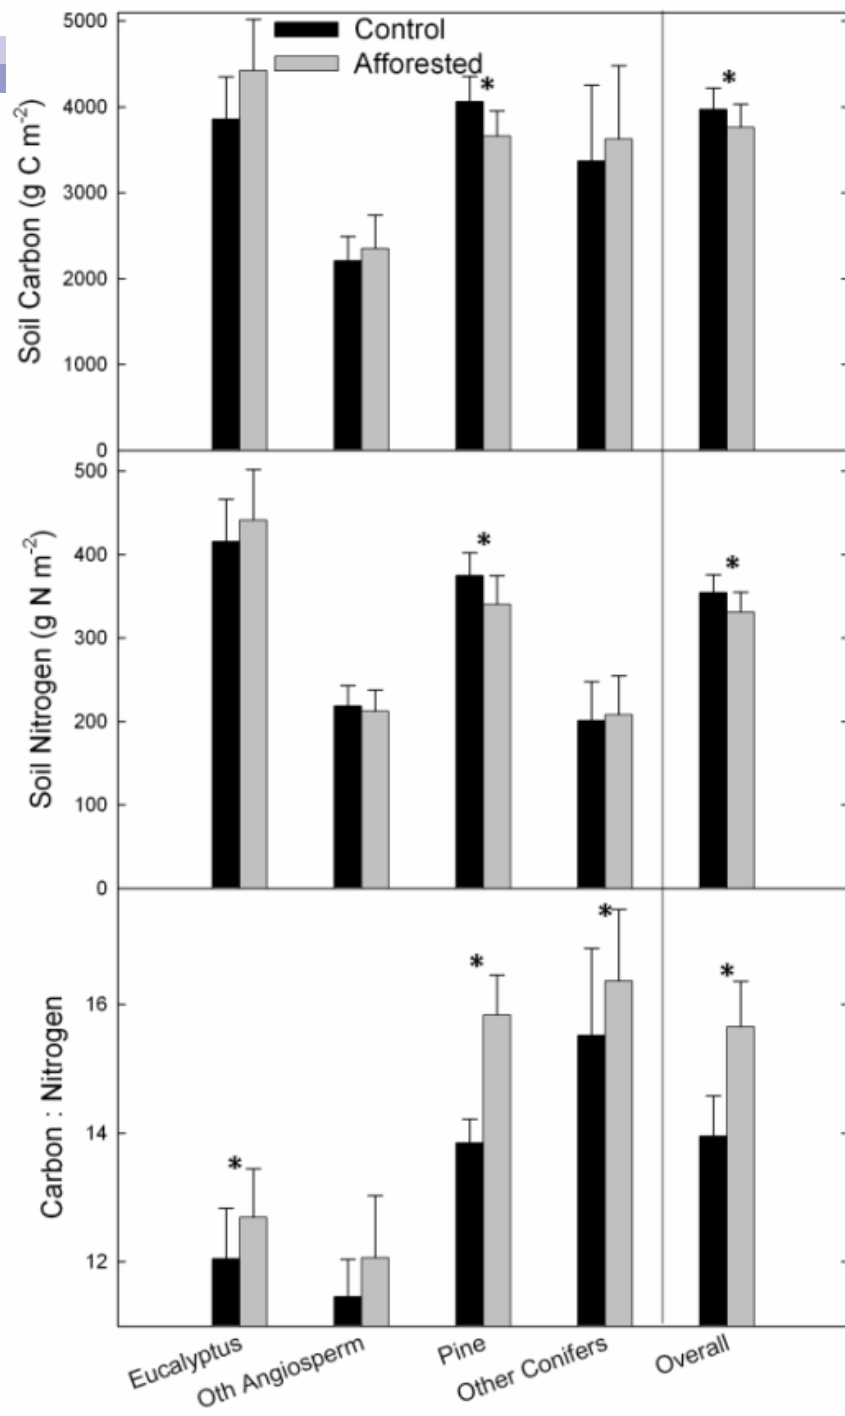

# Bootstrap: Non-parametric technique

- Resampling with replacement to generate 95% confidence intervals of response ratio

Exchangeable Cation Concentration  
(cmol(+) kg soil<sup>-1</sup>)

Decrease due to  
pine afforestation

Decrease due to  
afforestation with pine,  
eucalyptus, and conifers

# Carbon Loss and Sequestration?

- Average soil C loss = 4.1 Mg C / ha
- Average 20 year rotation plantation = ~75 Mg C / ha
- So ~5.5% of biomass C sequestered is lost from soil C

# Digression: C loss in Context

Pine plantation sequesters  
~3750 kg CO<sub>2</sub>-C per hectare year

Soil C losses =  
~205 kg CO<sub>2</sub>-C per hectare year

+

=

573 kg CO<sub>2</sub> per  
year for me  
1146 normal US  
driver

∴ 1 ha pine = around 6.2 of my cars  
Or 3.1 average US cars

Acidification due to  
Eucalypt, Conifers,  
and Pines

Base Saturation loss  
due to Pines and  
Conifers

# Source of Acidification

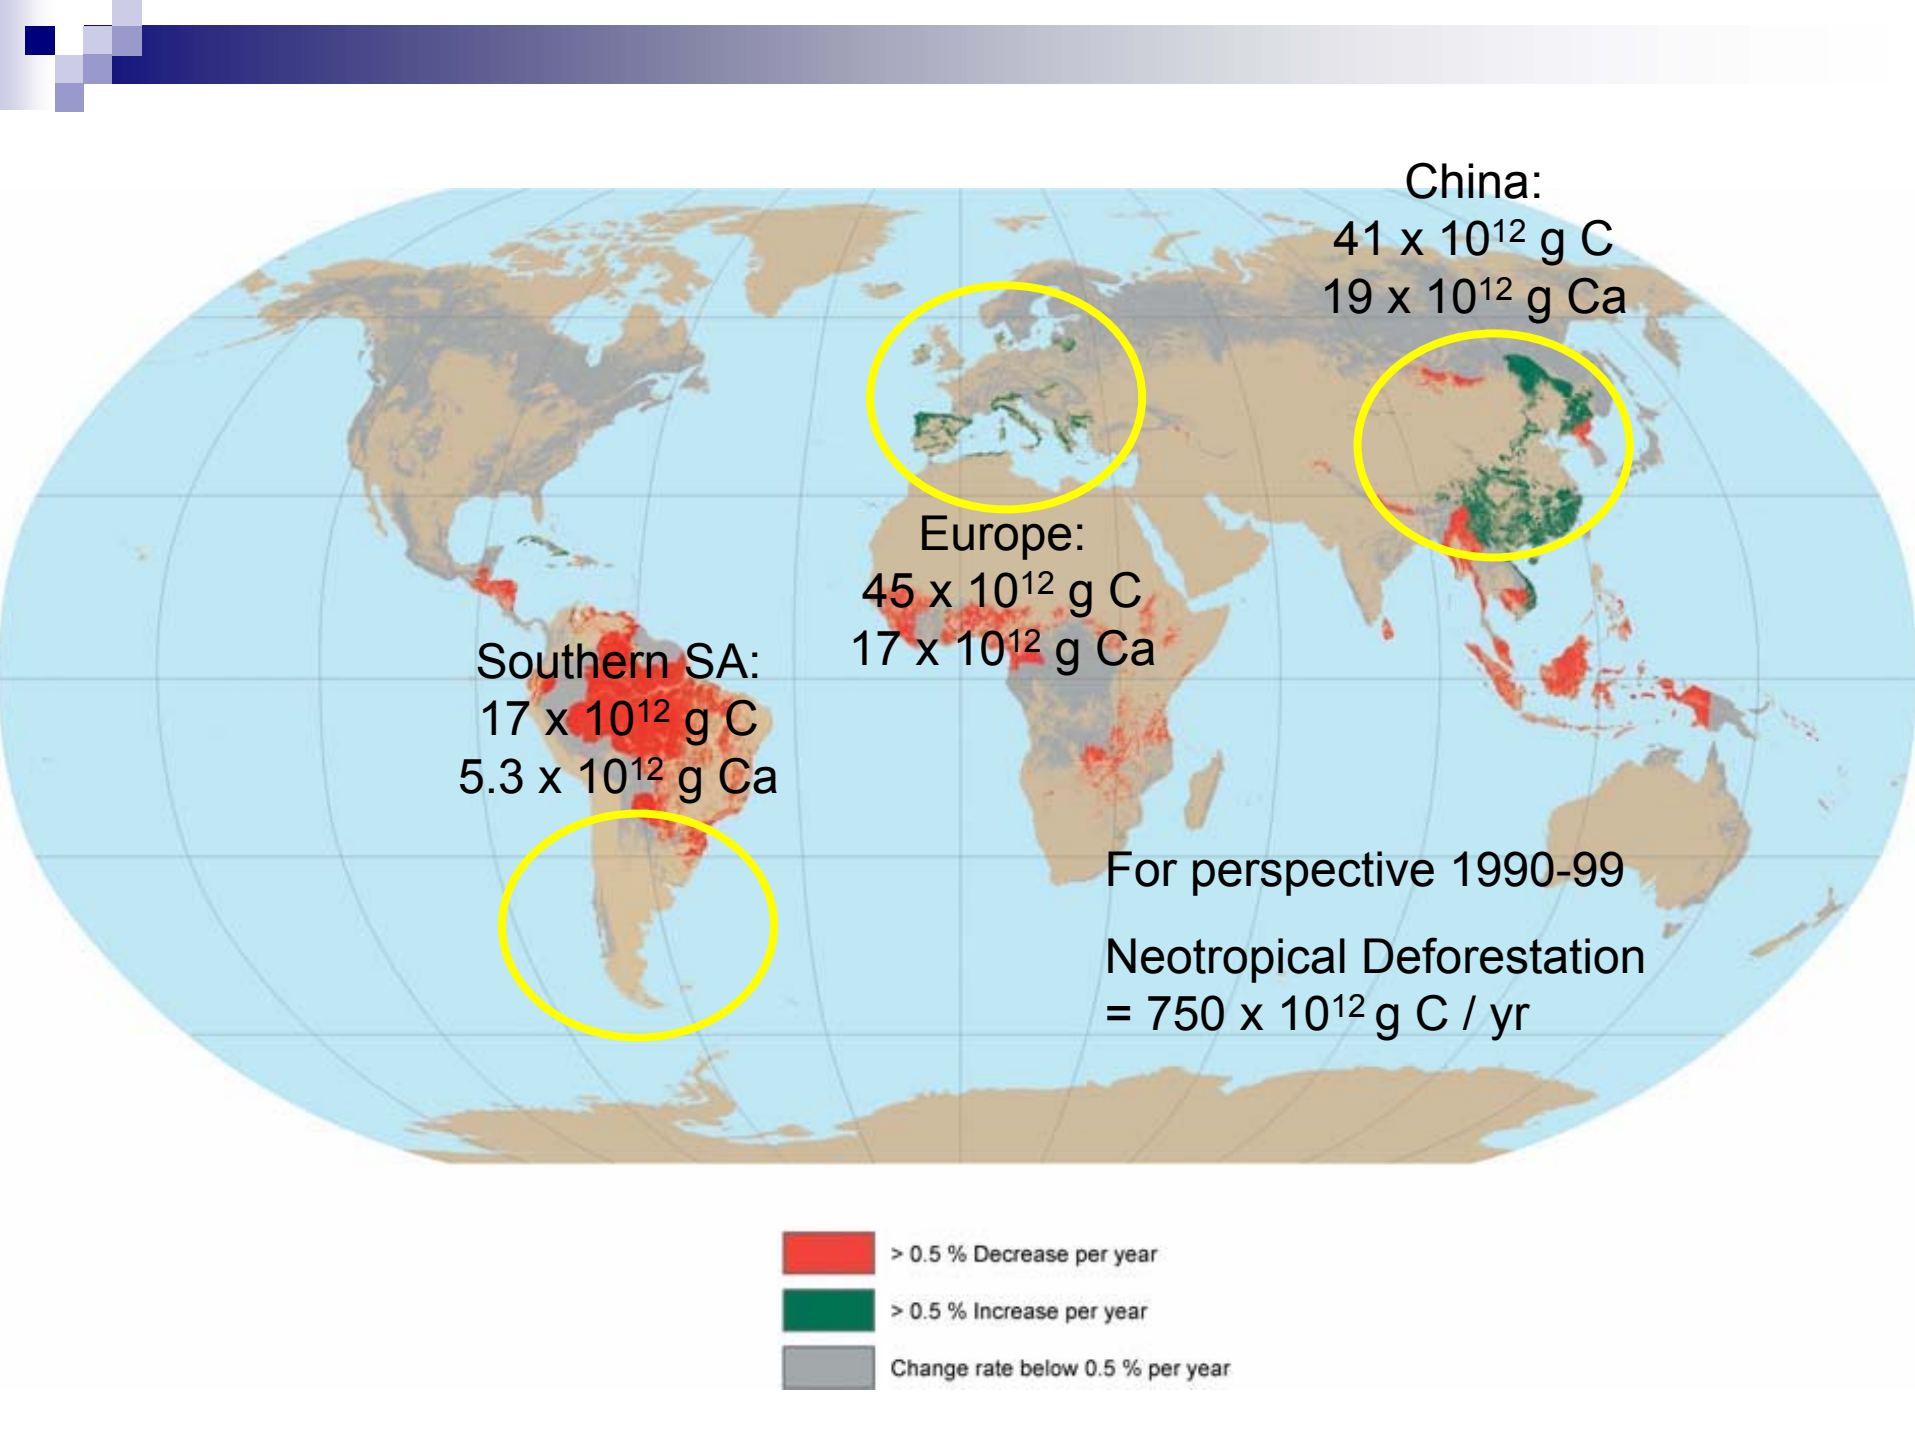

Spearman's  $\rho = -0.58$   
 $p = 0.006$ ,  $N = 21$

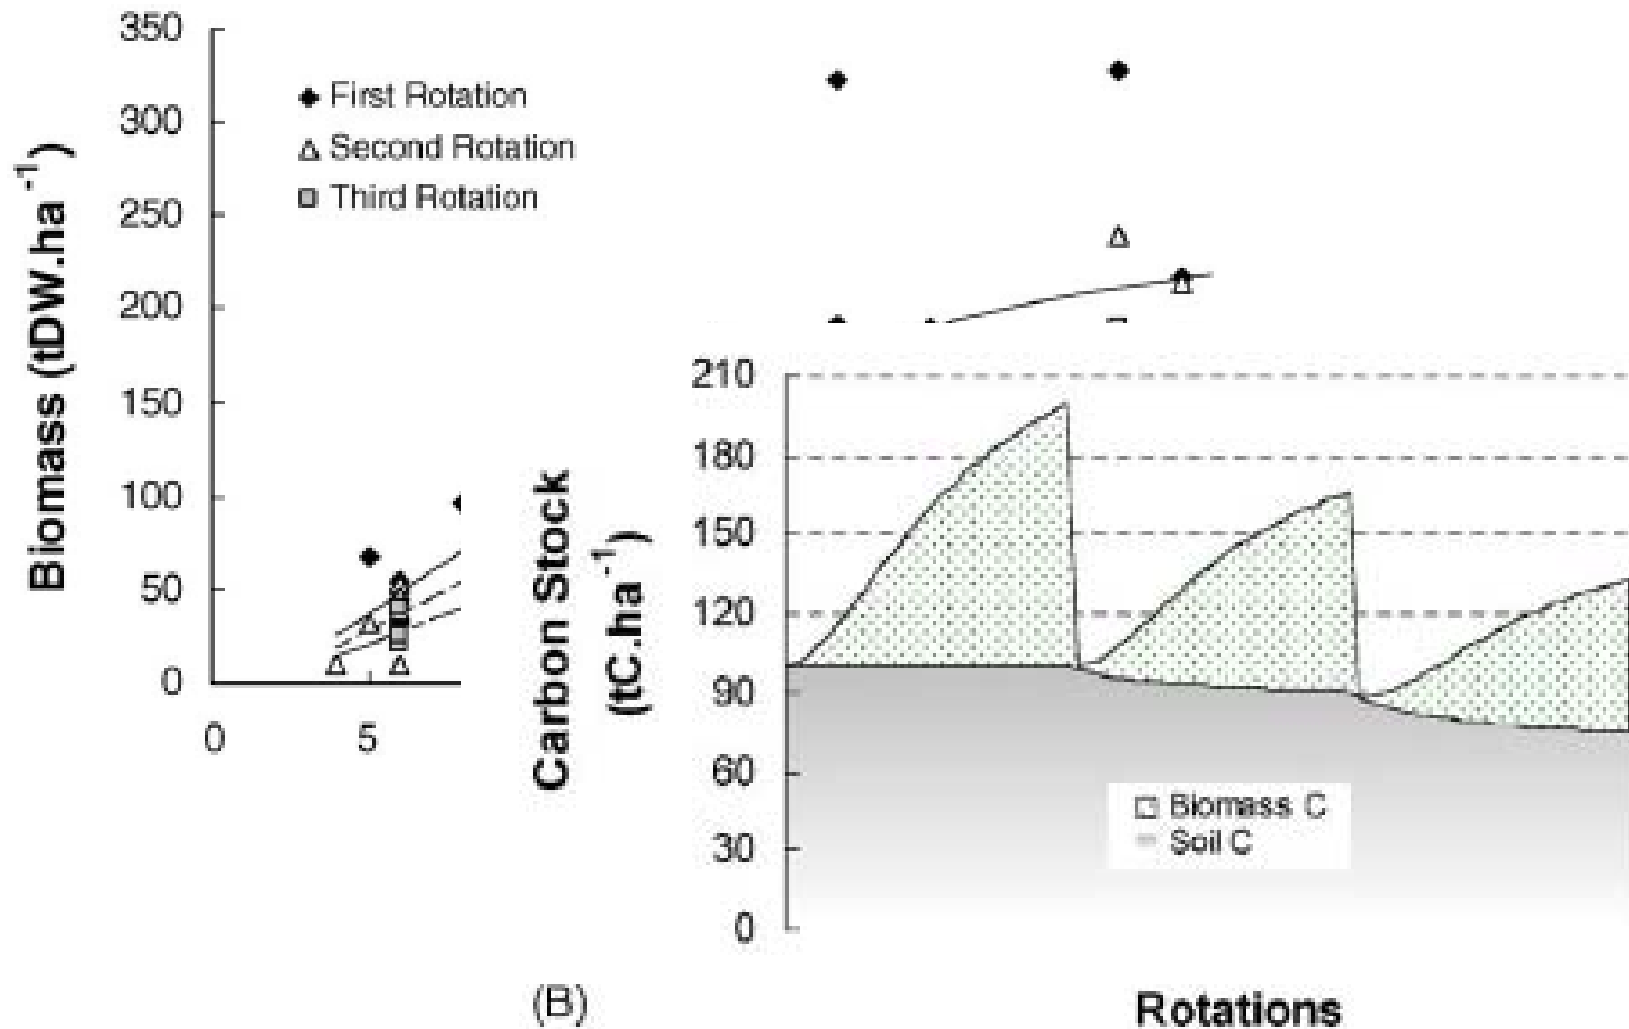

Spearman's  $\rho = -0.56$   
 $P < 0.0001$ ,  $N = 51$

# Result Summary

- Loss of exchangeable cations with afforestation
- C and N loss, but only with pines
  - But C:N increases
- Acidification common, related to cation losses

# Productivity through time

Exchangeable Cation Concentration  
(cmol(+) kg soil<sup>-1</sup>)

Data from Day and Monk 77

N in Foliage +  
Branch + Bark =  
88%

N in Woody  
Biomass = 12%

# Potential Amelioration

- On-site debarking and slash retention conserves cations and N
- Burning=net losses of C and N (combustion), non-burned=increased production (Mendham 2003)
- Logging residue retention also decreases compaction and erosion

# Conclusions

- Afforestation decreases the soil cation complex, carbon, N, pH, and BS%
- Represents significant portion of regional carbon pools that should be integrated into models
- Potential for sustainability through slash retention

# Global Forest Change

From FAO Forest Resource Assessment 2005

Plantations=3.8% of forest area

However, 35% of Wood products

Source=FAO, 2000

# Afforestation in South America

- Afforestation: Human conversion of land that has lacked trees for at least 50 years (Kyoto protocol) to forest.
- Historically Treeless
- Plantations as old as 150 yrs; many plantations starting 10-15 yrs
